<u>Emotion content</u>	<u>Cognition content</u>	<u>Action</u>
- What makes you feel proud of yourself? - Who inspires you to be your best? - How do you help others shine too? - Where do you have your energy from? Who do you give energy to?	- Stars are giant balls of hot gas (mainly hydrogen and helium) that produce light and heat through nuclear fusion. - They are born in nebulae — clouds of gas and dust that collapse under gravity. - Stars vary in size, color, and temperature (blue = hottest, red = coolest). - A star's life cycle includes formation, main sequence, and eventual death (white dwarf, neutron star, or supernova). - Our Sun is a medium-sized star, providing energy for all life on Earth.	- Star life cycle timeline illustrate or build a fold-out timeline showing the stages of a star's life, labeling each step with color and texture. - Constellation lanterns Use paper cups or jars; punch small holes forming star patterns. Place a small LED inside to show constellations glowing in the dark. - Star spectrum art Using colored chalk or watercolor, create a gradient of star colors from blue to red and label each with its temperature and size — a “stellar rainbow.”
